

Monthly FMP Refresh — Dry-Run Stats

Job: `monthly_fmp_refresh` | `ml.market_data_15m` + `market.daily_prices` | Generated 2026-06-22

1 Execution Summary

Field	Value
Command	<code>monthly_fmp_refresh.py --dry-run --symbols SPY --month 2026-05</code>
Outcome	SUCCESS — “Dry run completed successfully.” (exit code 0)
Mode	monthly-refresh
Data source	FinancialModelingPrep (live API)
DB writes	None (dry-run)

2 Core Stats (dry_run_summary.json)

Metric	Value
<code>completed_at_utc</code>	2026-06-22T00:02:42Z
<code>start_date</code> → <code>end_date</code>	2026-05-01 → 2026-05-31
<code>symbols_loaded</code>	1 (SPY)
<code>reference trade dates</code>	20
<code>intraday_rows_detected</code>	520 (15-minute bars)
<code>bars per trade date</code>	~26 (520 / 20)
<code>chunk_days</code>	5

3 Data Quality

Check	Result
<code>unresolved_days</code>	0 ✓ (no missing trade days vs SPY reference schedule)
<code>null_rows</code>	0 ✓ (no null OHLCV / timestamp rows)
<code>daily_price_failures</code>	0 ✓ (n/a in dry-run; no failure report written)
<code>validation gate</code>	PASS — no failure reports emitted

4 Defect Found & Fixed (caught by the dry-run)

The DAG read reports from a different directory than the script writes them to — `validate_reports / publish_summary` would have failed on every otherwise-successful run.

Item	Detail
Script writes to	<code>ml/ml/data/monthly_refresh_reports/</code>
DAG read from (before)	<code>ml/data/monthly_refresh_reports/</code> ✗ one level too high
DAG reads (after fix)	<code>ml/ml/data/monthly_refresh_reports/</code> ✓ matches
Fix	DAG line 24: <code>REPO_ROOT / 'ml' / 'ml' / 'data' / ...</code>
Re-verified	summary file EXISTS at DAG path = True; dry-run re-run exit 0

5 Report Files the Job Emits

File	When	Meaning
dry_run_summary.json	dry-run OK	the stats above
last_success_summary.json	real-run OK	intraday upserts, feature updates, daily-price upserts
unresolved_intraday_gaps.json	on failure	missing trade days → DAG fails
null_ohlcv_rows.json	on failure	null OHLCV/timestamp rows → DAG fails
daily_price_failures.json	on failure	symbols with failed daily fetch → DAG fails
resume_checkpoint.json	during run	per-symbol progress for --resume-from-checkpoint

6 Notes

- Scope: single symbol (SPY, the reference symbol) for May 2026 — kept small to confirm execution without burning API quota on the full 504-symbol universe.
- Environment: live FMP API; throwaway local Postgres (since removed); deps in a temp venv (since removed).
- The dry-run JSON artifact was a runtime output and was cleaned up; it is not committed to git.
- Code committed as 1ad1d81 (DAG + script, incl. the path fix); not yet pushed.
